Amendments to the claims:

This listing of claims replaces all prior versions and listing of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for administration and replication of a database, comprising ~~the steps of:~~
 - providing a database management system with a built-in random sampling facility configured as an integral part of said database management system, whereby the random sampling facility has access to low level functions and buffers of the database management system; and,
 - executing said random sampling facility from within the database management to perform a replication operation on said database;
 - defining a database record sample size S;
 - randomly sampling S records of the database using said random sampling facility;
 - storing statistics for each of said S records, wherein said statistics include a record key for each record; and,
 - producing an extrapolated replication partition analysis based on said statistics, wherein said replication operation is based on said extrapolated replication partition analysis.
2. (Canceled)
3. (Currently Amended) The method as set forth in claim ~~[[2]]~~ 1, wherein ~~the step of~~ said defining said sample size S includes:
 - defining a default sample size;
 - selectively receiving a desired sample size; and,
 - setting said sample size S as said default sample size when the

Application No. 09/897,803

Reply to Advisory Action of December 23, 2004 and
Office Action of October 6, 2004

desired sample size is not selectively received, and setting said sample size S as said desired sample size when the desired sample size is selectively received.

4. (Currently Amended) The method as set forth in claim 1, further comprising ~~the steps of:~~

~~defining a database record sample size S;~~
~~randomly sampling S records of the database using said random sampling facility;~~
~~storing statistics for each of said S records, wherein said statistics include a record key for each record; and,~~
producing a partial replication partition analysis based on said statistics.

5. (Currently Amended) The method as set forth in claim 4, wherein ~~the step of said~~ defining said sample size S includes:

defining a default sample size;
selectively receiving a desired sample size; and,
setting said sample size S as said default sample size when the desired sample size is not selectively received, and setting said sample size S as said desired sample size when the desired sample size is selectively received.

6. (Currently Amended) A method for database administration and replication, comprising ~~the steps of:~~

providing a database management system with an integrated a random sampling facility as an integral part of the database management system, the random sampling facility having access to low level functions and buffers;

selecting a default sample size value S, wherein S is a value of said selected default sample size;

selectively receiving a desired sample size value D and setting said

Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6,, 2004

default sample size value S to said desired sample size value D when said desired sample size value D is received;

randomly sampling S records of the database using
said random sampling facility;

storing statistics for each of said S records, wherein said statistics include a record key for each record; and,

producing at least one of an extrapolated replication partition analysis based on said statistics; and a partial replication partition analysis based on said statistics; and,

performing a replication operation on said database.

7. (Currently Amended) A method for database administration and replication, comprising:

providing a database management system with an integrated a random sampling facility as an integral part of the database management system, the random sampling facility having access to low level functions and buffers;

selecting a default sample size value S, wherein S is a value of said selected default sample size;

selectively receiving a desired sample size value D and setting said default sample size value S to said desired sample size value D when said desired sample size value D is received;

randomly sampling S records of the database using
said random sampling facility;

storing statistics for each of said S records, wherein said statistics include a record key for each record; and,

producing at least one of an extrapolated replication partition analysis based on said statistics; and a partial replication partition analysis based on said statistics; and,

performing a replication operation on said database, wherein the

Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6, 2004

selecting said default sample size value D further includes:

- generating a table of S number pairs (Y_j, I_j) $j = 1, 2, \dots, S$, wherein all Y and all I are initially set to zero;
- initializing a reservoir of records to an empty state;
- setting an index M to said reservoir equal to zero;
- generating a sequence of N non-repeating random numbers U_1, U_2, \dots, U_N , $0 < U < 1$, wherein N is the number of records in the database; and,
- performing additional steps for each random number U_k generated, $k=1, 2, \dots, N$, the additional steps including:
 - skipping the next record in the database if U_k is less than the smallest value of Y in said table of S number pairs; and,
 - updating the table of S number pairs if a Y less than U_k exists by performing further steps including:
 - setting M equal to its current value plus one;
 - replacing the smallest Y in the table of S number pairs with U_k ;
 - setting the I value paired with the smallest Y equal to M; and,
 - storing all or part of the next record of the database in said reservoir of stored records, wherein the current value of M is a reservoir index to said stored record.

8. (Currently Amended) The method as set forth in claim 7, wherein the step of updating the table of S number pairs further includes the step of:

- arranging the table in a heap with respect to Y.

9. (Currently Amended) The method as set forth in claim 6, further comprising the step of:

- sorting said stored statistics by key prior to producing said at least one of said extrapolated replication partition analysis and said partial replication partition analysis partition analysis.

Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6,, 2004

10. (Currently Amended) The method as set forth in claim 9,
further comprising ~~the steps of:~~

accessing all database records in an arbitrary sequence;
iteratively filling all ~~of said~~ partitions except ~~the a~~ last said partition
with said accessed records to a maximum byte count; and,
storing remaining accessed records in the last ~~of said partitions~~
partition.

11. (Currently Amended) The method as set forth in claim 6,
wherein ~~the step of~~ said storing statistics includes storing said statistics in a
memory.

12. (Currently Amended) The method as set forth in claim 11,
wherein ~~the step of~~ said storing statistics includes storing said statistics in said
memory in a compressed format.

13. (Currently Amended) The method as set forth in claim 6,
wherein ~~the step of~~ said producing at least one of said partition analyses
includes the step of defining multiple partition boundaries.

14. (Currently Amendeddd) The method as set forth in claim 6,
wherein ~~the step of~~ said sampling said S records includes randomly
sampling the S records utilizing dataspace including:

at least one index dataspace;
at least one key dataspace; and,
at least one statistics dataspace.

15. (Currently Amended) A database management system
(DBMS) for managing an associated database, the DBMS comprising:

Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6,, 2004

random sampling facility configured as part of the database management system and having access to low level functions and buffers of the database management system;

first database analysis tools using said integrated random sampling facility for generating extrapolated reports on database content;

second database analysis tools using said integrated random sampling facility for generating extrapolated reports on database size; and,

database replication tools adapted to execute at least one of a complete replication having output partition sizes determined by extrapolating a random sample of said database, and a partial replication in which the data stored in the partial replication comprises a random sample of said database;

a pre-configured number S defining a default sample size;

a means for selectively receiving a particular number defining a desired sample size and setting said number S equal to said particular number;

a means for randomly sampling S records of the database using said random sampling facility;

a means for storing statistics for each of said S records, wherein said statistics include a record key for each record; and,

a means for producing at least one of:

an extrapolated database content analysis based on said statistics;

an extrapolated partition analysis based on said statistics;

and,

a partial partition analysis based on said statistics.

16. (Canceled)

17. (Previously Presented) A database management system of claim [[16]] 15, further comprising:

*Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6, 2004*

a means for sorting said stored statistics by key prior to producing at least one of said analyses.

18. (Previously Presented) A database management system (DBMS) for managing an associated database, the DBMS comprising:
- random sampling facility configured as part of the database management system and having access to low level functions and buffers of the database management system;
 - first database analysis tools using said integrated random sampling facility for generating extrapolated reports on database content;
 - second database analysis tools using said integrated random sampling facility for generating extrapolated reports on database size;
 - database replication tools adapted to execute at least one of a complete replication having output partition sizes determined by extrapolating a random sample of said database, and a partial replication in which the data stored in the partial replication comprises a random sample of said database;
 - a pre-configured number S defining a default sample size;
 - a means for selectively receiving a particular number defining a desired sample size and setting said number S equal to said particular number;
 - a means for randomly sampling S records of the database using said random sampling facility;
 - a means for storing statistics for each of said S records, wherein said statistics include a record key for each record; and,
 - a means for producing at least one of:
 - an extrapolated database content analysis based on said statistics;
 - an extrapolated partition analysis based on said statistics;
 - and,
 - a partial partition analysis based on said statistics, wherein said means for randomly sampling S records further comprises:

*Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6, 2004*

a means for generating a table of S number pairs (Y_j, I_j) , $j=1,2,\dots,S$, wherein all Y and all I are initially zero;

a means for initializing a reservoir of records to an empty state;

a means for setting an index M to said reservoir equal to zero;

a means for generating a sequence of N non-repeating random numbers U_1, U_2, \dots, U_N , $0 < U < 1$, wherein N is the number of records in the database; and,

a means, for each random number U_k generated, $k=1,2,\dots,N$;

comprising:

a means to skip the next record in said database if U_k is less than the smallest value of Y in said table of number pairs; and,

a means to update the table if a Y less than U_k exists,

comprising:

a means to set M equal to its current value plus one;

a means to replace the smallest Y in the table with U_k ;

a means to set the I value paired with the smallest Y equal to

M; and,

a means to store all or part of the next record of said database in said reservoir of stored records, wherein the current value of M is a reservoir index to said stored record.

19. (Original) The database management system of claim 18 wherein the means to update the table further comprises:

a means to arrange the table in a heap with respect to Y.

20. (Original) The database management system of claim 18, wherein said means for storing statistics comprises a means for storing said statistics in memory.

21. (Original) The database management system of claim 20,

*Application No. 09/897,803
Amendment Dated January 19, 2005
Reply to Advisory Action of December 23, 2004 and
Office Action of October 6,, 2004*

further comprising:

a means for sorting said stored statistics by key prior to producing at least one of said analyses.

22. (Original) The database management system of claim 21, wherein said partition analyses include analyses of multiple partition boundaries.

23. (Original) The database management system of claim 22, further comprising:

a means for accessing all database records in an arbitrary sequence;

a means for iteratively filling all of said partitions except the last with said accessed records to a maximum byte count; and,

a means for storing remaining accessed records in the last of said partitions.

24. (Original) The database management system of claim 16, further comprising:

a means for utilizing at least one index dataspace;

a means for utilizing at least one key dataspace; and,

a means for utilizing at least one statistics dataspace.
